

## Partial Views

In this assignment, you will continue developing the list of people that you added to in the last assignment, changing the general layout and structure of how the names are displayed.

### Required Features:

- Rework the display of the person list to be based on partial views displayed in a list instead of using a table.

### Code Requirements:

- Instead of being rows in a table, each item in the list should be defined as a “tile” of html code – basically a page fragment on its own.
  - This fragment should be defined inside its own partial view, instead of in the view itself.
  - The partial view should take one instance of the person as its model.
